TRACKING TB ACROSS SPACE AND TIME

2023

This image maps the paths of several hundred human macrophages, shown in fluorescent green, following infection with the bacteria that causes Tuberculosis (TB) - Mycobacterium tuberculosis, shown in fluorescent magenta.

Time is projected across a third spatial dimension (right to left) to help visualise cell movement and distribution across a laboratory growth environment. Each tail traces the exact route of a macrophage cell over three days of infection - white tails mark uninfected cells, and purple tails show infected ones.
